spermvital

il seme che dura il doppio

Estende la vita degli spermatozoi fino a 48 ore

L'idea alla base della tecnologia **SpermVital** è di estendere la vita degli spermatozoi dopo l'inseminazione. Per ottenere questo risultato, gli spermatozoi vengono immobilizzati in una sostanza naturale prima della crioconservazione. Tale immobilizzazione consente di conservare l'energia degli spermatozoi e permette un rilascio controllato degli stessi all'interno dell'utero per un periodo di tempo più lungo del normale. Il momento in cui avviene l'inseminazione rispetto all'ovulazione nella femmina riveste quindi un ruolo meno fondamentale e le possibilità di fecondazione vengono aumentate.

VANTAGGI:

- Il momento dell'inseminazione è meno critico.
- Permette di fecondare con più flessibilità rispetto il momento centrale del calore
- Le inseminazione per calore possono essere ridotte, evitando quindi le doppie fecondazioni.
- E' utile quando i colori sono poco evidenti e deboli.

AUMENTO FINO AL 38% DEL TASSO DI CONCEPIMENTO

Il tasso di concepimento è aumentato in media del 25%: dal 33.5% con seme ordinario, al 41.9% con seme **SpermVital**. La differenza nel tasso di concepimento è aumentata con l'aumentare delle inseminazioni richieste. La differenza nel tasso di concepimento tra seme SpermVital e seme ordinario era del 38% in vacche che richiedevano più di tre inseminazioni. Questi incredibili risultati mostrano che nelle vacche che tornano in calore, il tasso di concepimento aumenta notevolmente quando viene utilizzata la tecnologia SpermVital.
